

T■RO · WH■NAU NAVIGATOR

Three agents. One wedge.

Kid Money · Term Planner · Holiday Ideas
Built for NZ wh■nau. Designed to be filmed.

Prepared for: Kate Hudson, Founder & Director, Assembl Ltd

Date: 12 May 2026

Status: Build spec — ready for CANON plugin scaffolding

The thesis

T■RO wins the NZ wh■nau category not by being a better family calendar but by being the first family agent that knows New Zealand. School terms, OSCAR, Hero notifications, Pak'nSave pricing, Kiwibank kids' accounts, tikanga around mahi and koha. Each agent below has a visible artefact, a measurable parent win, and a built-in reason for someone to film themselves using it.

T■RO · AGENT 01

Kid Money

The viral wedge. A chore-and-allowance agent that pays kids in their actual bank account, teaches them to split each payment three ways, and turns the weekly settle-up into something kids want to post.

THE PRODUCT IN ONE SCREEN

Parent sets up jobs in T■RO — "empty the dishwasher", "mow the front lawn", "walk Marley" — each with a rate by age band. Kid does the job, takes a photo on their own phone, hits done. T■RO scores the photo (is the dishwasher actually empty?), the parent gets a one-tap approve, and the money moves the same day from the parent's account to the kid's account via open-banking payment initiation.

Each payment is auto-split into three jars on the kid's side — **Spend, Save, Give** — with defaults set by the parent and editable by the kid as they grow. The Give jar can go to a NZ charity the kid picks (SPCA, KidsCan, Forest & Bird) once it hits \$5.

WHY IT GOES VIRAL

- **Visible artefact.** Money moving into a kid's account is the most photogenic feature in any family app. Cash apps for adults (Wise, Revolut) own this aesthetic. Nobody owns it for kids.
- **High-velocity demographic.** 10–16yo NZ kids on TikTok post multiple times a week. They'll film themselves doing chores. They'll film themselves getting paid. They'll film the Give-jar donations.
- **Measurable parent ROI.** "We haven't argued about chores in six weeks" is the testimonial that sells subscriptions. We make sure every parent can run a six-week comparison in-app.
- **Built-in growth loop.** Kids invite their friends — "my mum pays me through this app, get yours to download it". One household signs up multiple kids and refers other households.

THE NZ MOAT (NOBODY ELSE HAS THIS)

The Customer and Product Data Act 2025 makes payment initiation a designated action in New Zealand. ANZ, ASB, BNZ and Westpac became designated data holders on 1 December 2025; Kiwibank joins for payments on 1 June 2026 and for customer data on 1 December 2026. Banks cannot charge fees for these data transfers. This is a vertical moat that no global family app (Greenlight, GoHenry, BusyKid) can match in New Zealand — they all rely on issuing their own pre-paid card, which is a worse experience than money landing in the kid's actual bank account.

T■RO registers as an **accredited requestor** under the CDR. Application fee is \$1,500+GST (non-intermediary class) and renewals are \$1,000+GST. We meet the requirements via the Mana Trust Layer (once the security audit findings are closed) plus a partnership with a registered financial service provider for dispute resolution. This is a one-time investment that becomes a permanent barrier to entry for any non-NZ competitor.

TIKANGA OVERLAY

Kid Money is not just chore-tracking with a payment rail. The framing carries the four pou:

- **Mahi** — work is named with respect, not as a transactional exchange. Jobs are framed as "contributions to the wh■nau" not "tasks to earn money".
- **Koha** — the Give jar is set up as koha to the wider community, with the kid choosing the kaupapa (SPCA, KidsCan, Forest & Bird, their local marae if applicable).
- **Kaitiakitanga** — the Save jar reframes saving as "looking after future-you". Older kids unlock a Whakapapa view that shows their money decisions over time.
- **Manaakitanga** — birthday and Christmas modes let kids pool their Spend jars to buy a koha for someone else in the wh■nau, with T■RO suggesting age-appropriate gifts within the pooled budget.

These are *features*, not surface-level branding. They appear in the actual product flow and create stickiness that an Australian or American clone can't replicate without significant cultural work.

KID MONEY · MVP SCOPE (90-DAY BUILD)

PHASE 1 — Pre-CDR (weeks 1–6)

Ship without bank integration. Parents track payments manually — T■RO tells them "transfer \$14.50 to Tama this week" and they do it through their own banking app. Friction is intentional: we learn the chore-and-photo loop without the regulatory weight of being an accredited requestor.

- Chore library with age-banded default rates
- Photo-proof submission flow from kid's phone (via SMS link, no app install needed for kid in v1)
- Parent approve/reject queue with weekly settle-up summary
- Three-jar split visualisation on kid's web view
- Tikanga onboarding flow (the four pou, in plain language)

PHASE 2 — CDR-enabled (weeks 7–14)

File the accredited requestor application around week 4 (it takes 20 working days from technical info request). By week 10 we have live payment initiation with the four major banks; Kiwibank lands on 1 June which is roughly the same window.

- CDR consent flow for parents (one-time, bank-specific)
- Real payments from parent account to kid account, same day
- Confirmation of Payee check before each payment
- Audit log of every payment with bank reference numbers
- Privacy Act IPP 3A consent capture, refresh-on-change

PHASE 3 — Network effects (weeks 14–26)

- Multi-household chores: split tasks across separated parents' homes
- Cousin/friend co-pay flows: pool money for a shared gift
- Charity-side dashboard for SPCA/KidsCan/Forest & Bird showing Give-jar inflows
- School fundraising mode: T■RO + school combine for a bake-sale-style event

PRICING

Sits inside the existing T■RO Family tier at \$29/mo (per Kate's April 2026 pricing). Kid Money is not a paid add-on; it is the marquee feature that drives Family tier sign-ups. The Give-jar charity integrations may generate a referral fee from the charity side over time, but that is bonus revenue and never disclosed to users as a reason to choose one charity over another.

RISKS & MITIGATIONS

Risk	Mitigation
Accredited requestor rejection	File early. Use the Mana Trust Layer security work as evidence of controls. Partner with a
Kid privacy (under-13 data)	Kids never sign up themselves. Parents hold all accounts and consent. Kids interact via S
Photo-proof gaming	T■RO's vision check is suggestive, not authoritative. Parent always approves. Don't mark

Banks delay opt-in

We launch on the four majors from week 10. Kiwibank arrives 1 June for payments. Other

THE LAUNCH VIDEO (CONCEPT)

Cold open. A 12-year-old in a school uniform, holding a phone. Voiceover: "My mum pays me through an app now."

Cut to: kid emptying the dishwasher, takes a photo, hits done. We see T■RO on the kid's phone: "Mum approved. \$2.50 → Spend, \$1.50 → Save, \$1 → SPCA."

Cut to: the same kid two weeks later, opening the ANZ Go Money app, balance reads \$47.50. Voiceover: "I haven't asked her for money in three weeks."

Tag: T■RO. *The kid money agent. Made in Aotearoa.*

Distribution: 12 versions, A/B tested across the same three hooks. Run through the Larry Loop (dispatch-loop skill) once the agent is in soft launch with 20 households. Aim is one breakout video at >500k views in the first month.

Term Planner

The school-newsletter wedge, NZ-shaped. Forward anything from your kid's school — newsletter PDFs, Hero notifications, sports club WhatsApps, the dance recital email chain — and T■RO produces a term-shaped plan with everything in it: events, payments, gear, permission slips, RSVPs, holiday transitions.

BUILDING ON WHAT'S ALREADY STARTED

You've already started newsletter parsing — this spec assumes that extraction layer exists and focuses on the structuring, scheduling, and surfacing layers that sit on top of it. If the existing parser is text-only, we'll need to add vision support for PDFs and screenshots (most school comms are PDF, JPG, or screenshots from Hero).

THE PRODUCT IN ONE FLOW

Parent forwards an email to **term@toro.nz** or screenshots a Hero notification into the T■RO chat. The agent reads it, asks one clarifying question if needed ("is Maia in Room 14 or Room 12 this year?"), and then produces structured output:

- **Calendar events** with location, time, dress code, what to bring
- **Payment requests** with due date, amount, school bank account, reference
- **Gear lists** by date — "swimming togs week 3, mufti gold coin week 6"
- **Permission slips** flagged as needing parent signature, due date
- **Wh■nau alerts** — "this clashes with Nan's lunch on Thursday"

THE NZ-SPECIFIC KNOWLEDGE LAYER

This is the moat. Term Planner needs to know things that no global family app knows:

- **NZ school calendar.** Terms run roughly Feb–Apr, May–Jul, Jul–Sep, Oct–Dec, with the Ministry of Education publishing exact dates each year. Public, integrated, state-integrated, private — all slightly different. Holiday programmes start the day after term ends, not the following Monday.
- **NZ school rituals.** Swimming sports, athletics days, cross country, mufti days (gold coin koha for a charity, almost always), Pet Day (rural schools), Matariki celebrations, kapa haka performances, ERO weeks, Book Week, Pink Shirt Day.
- **NZ school platforms.** Hero, Seesaw, Skool Loop, Linc-ed, Edge, MyEd, KAMAR for secondary. Each one formats notifications differently. Term Planner needs parsers for the common ones.
- **NZ school finance.** Voluntary donations vs activity fees vs camp fees — different tax-deductibility rules. Term Planner should flag which ones generate an IRD donation receipt at year-end.
- **NCEA timeline.** For Y11–13 wh■nau, internal assessment dates, external exam timetables, derived grade applications, endorsement thresholds. This is a sticky feature for parents of secondary kids.

TERM PLANNER · ARCHITECTURE

Borrowing the Suki AI pattern: capture layer → structuring layer → bi-directional integration → privacy architecture.

Capture layer

- Email forwarding address per wh■nau (term-<wh■nau-id>@toro.nz)
- Screenshot upload via T■RO chat (vision-enabled)
- Direct integrations with Hero / Seesaw / Skool Loop once we have 100+ households on each
- PDF parser with table extraction (pdfplumber) for school newsletters

Structuring layer

Schema-driven extraction. Each parsed comm produces one or more typed events from a fixed taxonomy:

- event.calendar — dated, optionally recurring
- event.payment — amount, due date, payee, reference
- event.gear — item, date needed, optional cost
- event.permission — slip needed, signature deadline
- event.transition — term start/end, holiday window

Bi-directional integration

- Writes to parent's Google/Apple calendar with per-kid colour
- Writes payments to a 'school' label in their bank's bill-pay (post-CDR)
- Reads back from those calendars to flag conflicts before they happen
- Cross-checks with Holiday Ideas agent for school-holiday windows

Privacy architecture

Term Planner handles personal information about minors. This needs extra care under the Privacy Act 2020, specifically IPP 3A (effective 1 May 2026, requires direct notification when collecting from third parties).

- Email forwarding addresses are per-wh■nau, not per-school — schools never see T■RO addresses
- Child names extracted but never used in marketing or analytics
- All child-related personal info deleted within 90 days of family leaving T■RO
- No training on child data, ever — explicit clause in T&Cs;

PRICING

Same tier as Kid Money — \$29/mo Family. Term Planner is included; this is the agent that justifies the subscription in the eyes of parents with school-age kids. Kid Money is for the kid. Term Planner is for the parent. Both ship in the same tier.

THE KILLER DEMO

Parent forwards a 4-page school newsletter PDF at 9:47pm on a Sunday. T■RO replies within 60 seconds with:

"Read the Term 2 newsletter for Hawke's Bay Primary. Found 14 things for you:

This week: Mufti day Friday (\$2 koha for SPCA), swimming togs for Maia Wed–Fri.

Next week: Class trip permission slip due Mon, \$18 each for Maia and Tama, school account 12-3456-7890123-00.

Week 4: Cross-country, parent helpers wanted — want me to say yes for Adrian?

Week 7: Parent-teacher interviews, booking opens Mon 9am, I'll book you both.

Week 10: Last day of term, school finishes 12:30. Holiday programme bookings open at OSCAR providers from this Friday."

Parent hits ✓✓✓ to confirm and everything lands in their calendar, their bill-pay, and T■RO reminds them at the right times. This is the moment they tell other parents at the school gate.

Holiday Ideas

Four times a year, every NZ parent burns two evenings figuring out what the kids will do during the school holidays. OSCAR-approved programmes, sports camps, library activities, free council stuff, weekend day-trips, rainy-day plans for when Auckland decides to be Auckland. Holiday Ideas is the agent that does this in 10 minutes instead of two evenings.

WHY THIS IS BIGGER THAN PROGRAMMES

Holiday programmes are a small piece. Most NZ parents only put their kids in OSCAR or sports camps for 5–10 days across the year. The rest is mixed — Nan has them Mondays, a grandparent flies up to Auckland for a week, a parent takes leave, there's a long weekend trip to Lake Taup■, plus the random days where everyone's home and the question is just "what are we doing today."

Holiday Ideas covers all of it. Programmes are one source of options. Free council activities, library holiday programmes, museum & gallery family days, beach days with tide times, rainy-day backup plans by suburb, day-trip ideas with driving time and cost, are all in the same recommendation engine.

WHAT IT DOES

At the start of each school holiday window (Term Planner already knows when), Holiday Ideas auto-generates a draft plan and asks the parent to confirm the rough shape:

- Which days are 'parent home' vs 'kids need to be somewhere'
- Budget across the two-week window
- Kids' interests (filled in once at onboarding, refined over time)
- Any travel — "we're in W■naka for the long weekend"

Then it produces a day-by-day plan with three tiers of options per day:

- **The plan** — T■RO's best pick, ready to book
- **Alt.** — a backup if the first one's full or the weather turns
- **Free option** — always one zero-cost activity, every day, no exceptions

THE NZ-SPECIFIC KNOWLEDGE LAYER

- **OSCAR registry.** Ministry of Social Development publishes the list of OSCAR-approved providers. T■RO mirrors this nightly. WINZ OSCAR subsidy eligibility is calculable from income bracket — we ask the parent once, save it, and show subsidised prices automatically.
- **Council holiday programmes.** Auckland Council, Wellington City Council, Christchurch City Council all run free or low-cost holiday activities. URLs change. We need scrapers per council, refreshed monthly.
- **Library programmes.** Auckland Libraries' summer programme is huge and free. Other regions vary. Scrape library websites and the Kotui shared catalogue for events.

- **DOC junior ranger and Kiwi Guardians.** Free, outdoorsy, national-park-shaped activities for kids who want to be outside. DOC's Toyota Kiwi Guardians programme has 50+ locations across NZ.
- **MetService.** Three-day forecast informs the indoor/outdoor balance of the plan. If rain is forecast Thursday, swap the beach for MOTAT.
- **NZTA tide times.** For beach days at Piha, Muriwai, Mt Maunganui, Sumner — tide times drive whether it's safe and whether the kids will have fun (low tide = rockpools, high tide = waves).

HOLIDAY IDEAS · ARCHITECTURE

Three layers: data ingestion (nightly), preference learning (per wh■nau, continuous), plan generation (on-demand and triggered).

Data ingestion (nightly)

- OSCAR provider list from MSD
- Council holiday programme pages (one scraper per council)
- Library event calendars
- DOC junior ranger / Kiwi Guardians locations
- Te Papa, MOTAT, Auckland Museum, Christchurch Art Gallery, etc. — family events
- Sport NZ regional trust events

Preference learning (continuous)

Each plan that the parent accepts, rejects, or modifies feeds back into the preference model. The kid's interests, the parent's budget tolerance, the household's typical radius from home, all get refined over time. By the third school holiday, recommendations are noticeably better than the first.

Plan generation (triggered)

- Two weeks before each school holiday window (Term Planner triggers this)
- Friday afternoons during term, for the weekend ("this weekend" mode)
- Whenever a planned activity falls through (booking full, weather, kid sick)
- On-demand: parent says "what should we do today" and the agent answers in <30 seconds

THE KILLER FLOW

It's the Sunday before the July school holidays. T■RO pings the parent: "Holidays start Friday. Want me to draft a plan?" Parent says yes, answers three questions (budget, days they're working, kids' rough mood right now). T■RO produces:

"Two-week plan for the Hudson-Adrian wh■nau, July 4 – July 18. Total cost ~\$340 across 14 days, with 6 free days.

Mon 7th — Auckland Libraries Lego Club, Pt Chev branch, 10am. Free. Nan can drop off.

Tue 8th — Wet day forecast. MOTAT, free for under-16s with an adult member. You're already a member.

Wed 9th — OSCAR at YMCA Pt Chev, full day. \$42 (subsidised \$28 — you qualify). I've held a spot, want me to confirm?

Thu 10th — Piha, low tide is 11am, perfect for rockpools. Pack lunch. Free. Adrian's day off.

Fri 11th — DOC Kiwi Guardians at Cornwall Park, free, takes about 90 minutes..."

Parent taps approve. Everything lands in the calendar. The OSCAR booking goes through. The MOTAT plan gets a weather check the night before. The Piha trip gets a tide-time reminder Thursday morning. Two evenings of planning collapsed into two minutes.

HOW THE THREE AGENTS WORK TOGETHER

Each agent is useful alone. The compound effect is what makes T■RO different from a generic family app.

Shared context

All three read from and write to the same Supabase wh■nau_context table. Each child, parent, grandparent, and household relationship is stored once. Each agent uses what it needs:

- Term Planner knows which kid is at which school
- Kid Money knows the kid's age band (which sets chore rates)
- Holiday Ideas knows the kid's interests and the household budget

Shared events

All three write to a single wh■nau_calendar. School events from Term Planner, chore deadlines from Kid Money, holiday activities from Holiday Ideas, all show up in one view. The parent's Google or Apple calendar receives one combined feed.

Shared payments ledger

Once CDR is live, all three agents can initiate payments — Kid Money pays the kid, Term Planner pays the school, Holiday Ideas pays the OSCAR provider. Every payment goes through a single audit log with bank reference numbers. Parents get one weekly statement across all of it.

The compounding loop

Term Planner identifies the end-of-term date. Holiday Ideas uses that to trigger its plan. Kid Money runs a special "holiday chores" mode with higher rates during the school break. The kid earns more, the parent plans less, and the household runs on rails for two weeks.

GO-TO-MARKET

Launch order

- **Month 1–2:** Term Planner public beta. School-newsletter parsing is the hook. Free during beta.
- **Month 3:** Kid Money soft launch (pre-CDR, manual-transfer version). 20 households.
- **Month 4:** Kid Money public launch with CDR-enabled payments. **This is the viral launch.**
- **Month 5:** Holiday Ideas ships in time for July school holidays.
- **Month 6:** All three agents wrapped in a single T■RO Family \$29/mo subscription.

Distribution channels

- **TikTok / Reels.** Larry-Loop content engine (dispatch-loop skill) producing 3–5 posts a week, A/B tested.
- **School communities.** Soft outreach to school PTAs offering free Term Planner access for the school's families.

- **Mumsnet-equivalent NZ.** Kiwi Families, Essential Mums, the NZ Parents Facebook groups — community-led, no ads.
- **Auckland Chamber of Commerce.** You already have connections — Kid Money has a small-business angle (parents who run businesses understand it as on-the-job training).
- **Charity partnerships.** SPCA, KidsCan, Forest & Bird co-promote the Give jar — they get a steady inflow of small donations, we get their email lists.

Success metrics

- Month 4: 1,000 households signed up to free Term Planner
- Month 6: 500 paid T■RO Family subscribers
- Month 6: one Kid Money TikTok at >500k views
- Month 12: 5,000 paid Family subscribers (\$145k MRR)
- Month 12: 100 schools onboarded via the PTA channel

WHAT I NEED FROM YOU TO BUILD THIS

Decisions

- Confirm T■RO stays at \$29/mo Family tier with all three agents included
- Confirm willingness to file as an accredited requestor under the CDR (~\$1,500+GST + insurance + FSP partnership)
- Pick the launch order — does Term Planner go first, or do we lead with Kid Money?
- Decide whether Holiday Ideas is included in Family tier or sits in a higher tier

Existing inputs to wire in

- Your existing newsletter parser — give me the schema it produces
- The T■RO agent system prompt (if it exists, otherwise we draft it)
- Supabase wh■nau_context and wh■nau_calendar schemas if drafted
- Confirmation that the eight ketes set in src/data/keteLabels.ts has T■RO correctly defined (was previously T■RO replacing HELM)

Next deliverables

- CANON plugin scaffolds for all three agents (agents/<slug>.md + skills/)
- Supabase migration files for the three shared tables
- System prompts for each agent with the four mandatory SKILL.md sections
- Initial landing page copy for toro.nz with the three agents as headline features
- First 12 TikTok video scripts for the Kid Money launch

Bottom line. Three agents that compound. One wedge that goes viral. A vertical moat (NZ CDR + tikanga + NZ school calendar) that no global family app can match. A launch sequence that ships Term Planner free in month one and rides that into paid Kid Money by month four. This is the part of Assembl that earns the brand recognition the rest of the platform needs.
